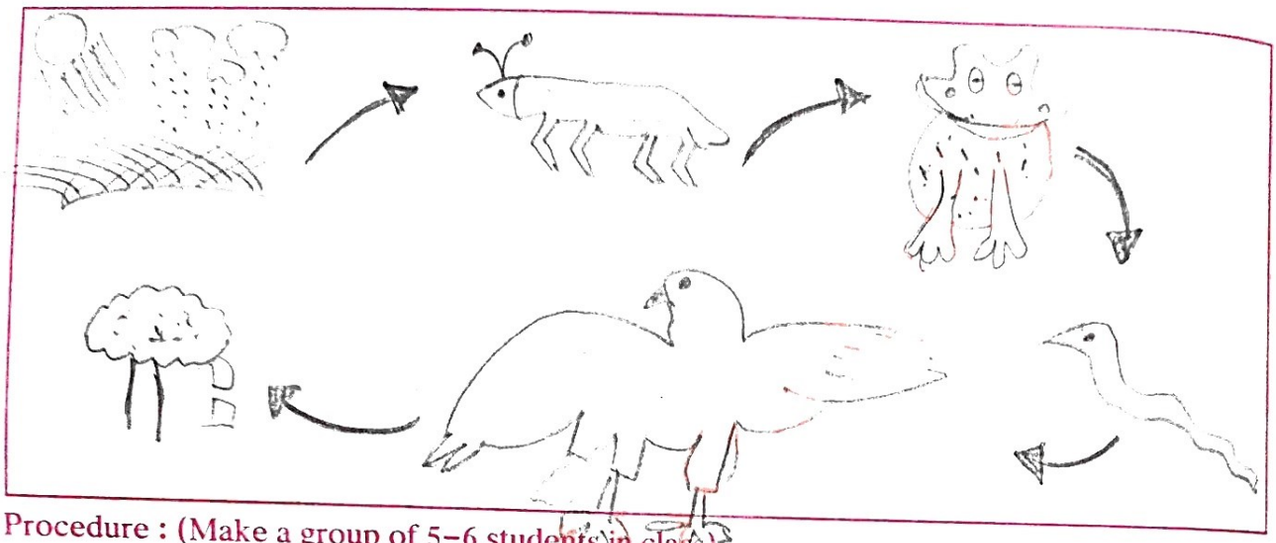
Experiment No. 3

Title : Sketching/ Drawing/ Constructing the food chains depending upon various components (Producers, Consumers) present in surroundings.

Apparatus/ Material : Observation chart, Pictures of observed Components.etc.

Figure : **Construct the food chain by using pictures**



Procedure : (Make a group of 5–6 students in class)

1. As per plan, search for various organisms in the surrounding of school.
2. Find and note down the food of organisms searched and classify them according to it.
3. Note the interrelationship between those consumers.
4. Construct a pyramid according to the correlation and type of food.
5. Paste the pictures of organisms observed by you and sketch the food chain.
6. Explain the food chain.
7. Ask for each group to present the presentation

Observation :

Observe the hierarchy of organisms according to trophic level in the food chain.

food chain is main source of energy if on produces neabivours eat them herbe vorous are eateh by carnivours apex consumers eat corning ours

Inference :

Organisms present around us are interdependent as follows.

There following trophic level :- producer herbevorous carnivorus an apex consumer to this level decomposers also than taken part in the food chain by carring out decomposition process.

Multiple choice Questions

1. Butterfly belongs to .....type of consumer.
   A. Primary B. Secondary C. Tertiary D. None of these
2. Out of the following animals..... is an example of omnivorous animal.
   A. Cow B. Grasshoper C. Caterpillar D. Sparrow
3. Foodweb consists of various .....
   A. Primary consumers B. Secondary Consumers
   C. Tertiary consumers D. Food chains
4. Autotrophic plants occupy the .....nutrition level of food chain.
   A. Tertiary B. Secondary C. Producer D. Top

Questions

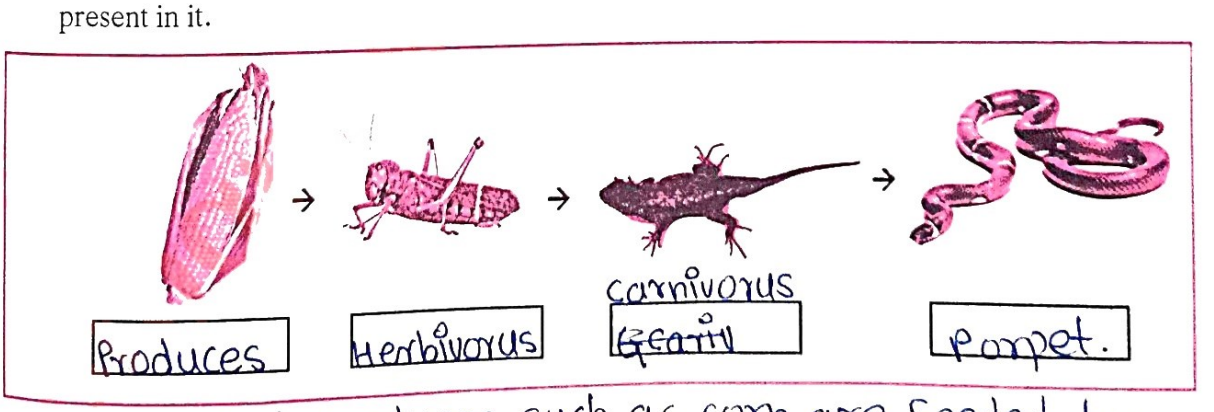
1. Heterotrophic (parasitic) plants occupy which trophic level in food chain? Why?

Heterophic are plants occpy it level in food chain becase all plants are producers plants take sun's energy by photosythesis hetrophic alway's depend upon them.

2. If consumers of specific level either increase or decrease in number, what will be effect on food chain?

If consumers of specific level either increase or decrease in no the food chain is in Balanced and then slowly-slowly all organisms represent in food chain destroy nature will also destroy.

3. Observe the picture given below and explain foodchain regarding the each component present in it.



we can that produces such as corn are feeded by prieanary consumer eat them the lizera feed in food chain on these herbivorus they occupy 2nd level in food chain the carnivors snake eats the lizard as food and occupy last stage.
