Experiment No.4

Title : Making a list (Study) of various organisms present in and around the water body nearby your school and explaining the food chain & food web according to their mode of nutrition.

Materials : Plain Paper, Pen/Pencil,Pointer, etc.

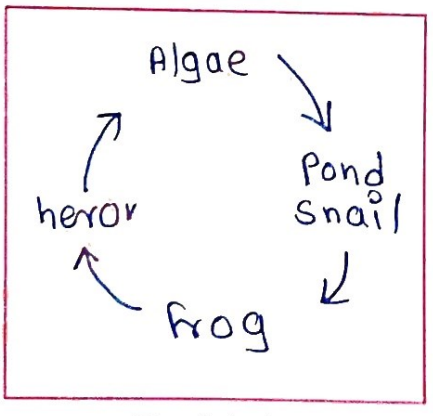
Procedure :

1. Observe the surroundings of your school in small groups of classmates.
2. With the help of your teacher, select a puddle or a pond having various organisms, nearby your school.
3. Divide the selected ecosystem into 4 – 5 parts.
4. Assign a study-group for each part.
5. Carefully observe the selected part under the guidance of your teacher.
6. Note down the name of each living organism observed there.
7. Pool the observations of all groups.
8. Depending upon the mode of nutrition of recorded organisms, construct food chain and food web.
9. Sketch the diagram of food chain & food web.

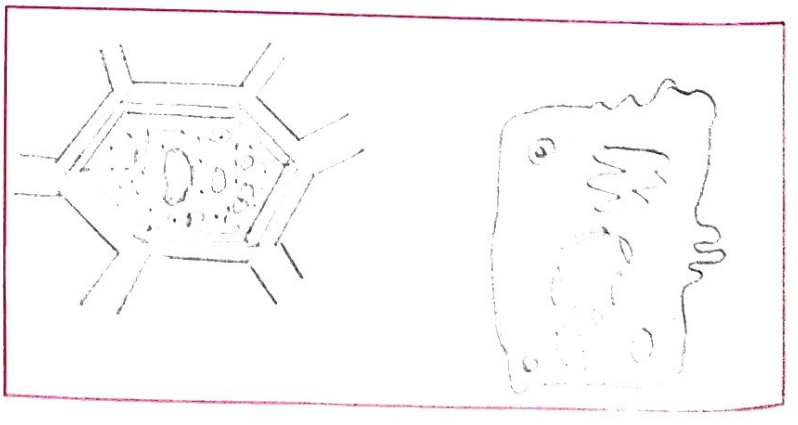
Observation :

The pond or puddle ecosystem showed the following organisms.

1) Green plant
2) Small fishers
3) fiber like rohu.
4) too toise



Foodchain



Foodweb

Inference :

Foodchain : The food chain stralight relation ship

Foodweb : The food chain web represent the completed network.

Multiple Choice Questions

1. In food chain, first trophic level is occupied by .....
   A. carnivores B. herbivores C. decomposers D. producers
2. In food chain, frog is .....
   A. primary consumer B. secondary consumer
   C. tertiary consumer D. producer
3. Food web consist of..... food chain/s.
   A. single B. more than two C. three D. zero
4. If decomposers had been absent .....
   A. it wouldn't have made any difference. B. there would have been heaps of garbage.
   C. no garbage would have been left. D. nutrients would have been thoroughly mixed with soil.

Questions

1. What do you meant by ecosystem?

~~Cu~~ cruthenation of many food chain of food web and those food web are known as ecosystem of that level.

2. What are differenced between food chain and food web?

Transformation of energy is 1st trophic level to another level is called food chain Interaction between many food chain called food web.

3. Which problems will arise if there is either increase or decrease in number of any component of food chain or food web?

This wood result a competition can amougst the consumers for food which would eventually distueb the food web and cause imbalance in ecosystem.

4. Draw the food web with the help of following pictures. How many food chains are present in that food web?

Their are many food chain are presen in food webe can't count it we can be seen produces are prey by the heabivors prey by canvores by apex consumers
