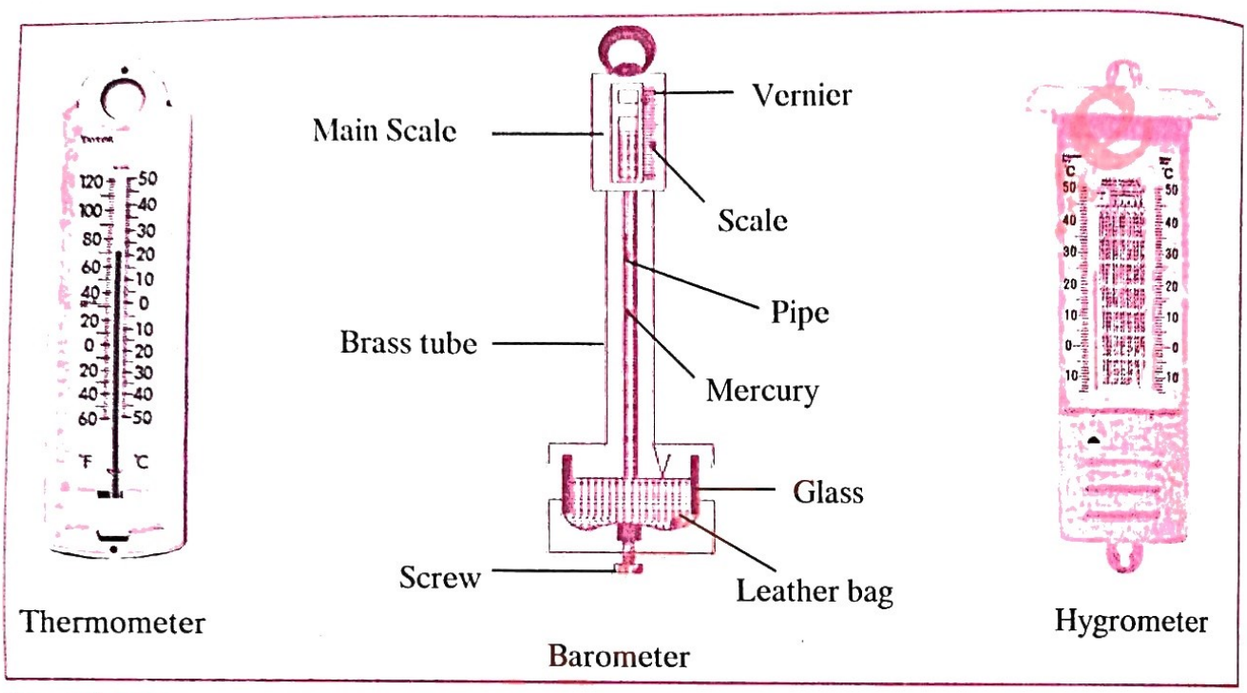
Experiment No.7

Title : Recording of air temperature, air pressure & humidity with the help of various instruments for a period of week and writing a report about it.

Instruments : Thermometer, Barometer, Hygrometer.



Procedure :

1. Collect the information about above mentioned instruments and practice for proper handling of those instruments.
2. Prepare a time-table for recording the observations.
3. Note down the readings in record-book as per the schedule so that you can determine the minimum & maximum readings.

Observation Table :

Sr. No.	Date	Temperature (°C)		Air Pressure (mbar)		Humidity (%)	
		Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
1		27	32	10mbar	30mbar	10%	60%
2		28	33	20m bar	31mbar	20%	50%
3		23	30	9m bar	31mbar	19%	15%
4		24	27	10m bar	40mbar	12%	30%
5		30	38	11m bar	19mbar	30%	60%
6		27	30	13m bar	20mbar	25%	35%
7		32	40	7mbar	17mbar	50%	70%

Inference :

Recordings of air temperature, pressure, & humidity from the date .....to .....

The weather conditions of a particular place depend upon the ambint tempretiare are pressure and the humidity Due to change in conditions, there are change in the wheather.

Multiple Choice Questions

1. For checking the dryness of air, ...instruments can be used.
   A. Barometer ✓B. hygrometer C. thermometer D. anemometer
2. When humidity is high, temperature is .....
   A. also high ✓B. low C. constant D. variable
3. At higher temperature, air pressure .....
   ✓A. increases B. decreases C. remains constant D.changes continuously.

Questions

1. What is the interrelationship between temperature, pressure & humidity of the air?

Air tempreture increclesses because the air contains more energy increasing corllsions and seprating air molecules when water molecules increases information the weight of the atmosphere are air pressure.

2. Which are the various instruments used in meteorology? For which purpose are they used?

1) Themometer :- used to calculate the atmosphere temprature.
2) Anemameter :- used to calculate the wind seep.
3) Barometer :- used to calculate the air pressure.
4) Hygrometer :- used to calculate the humidity.

3. What is your opinion about the climate of the week for which you recorded the readings? Depending upon those observations, what will you predict for forthcoming week?

My opinion about the recording of this weeks climate is that is currently to such cold out of spring explanation the prediction of the future climate is the that it is going to be spring.
