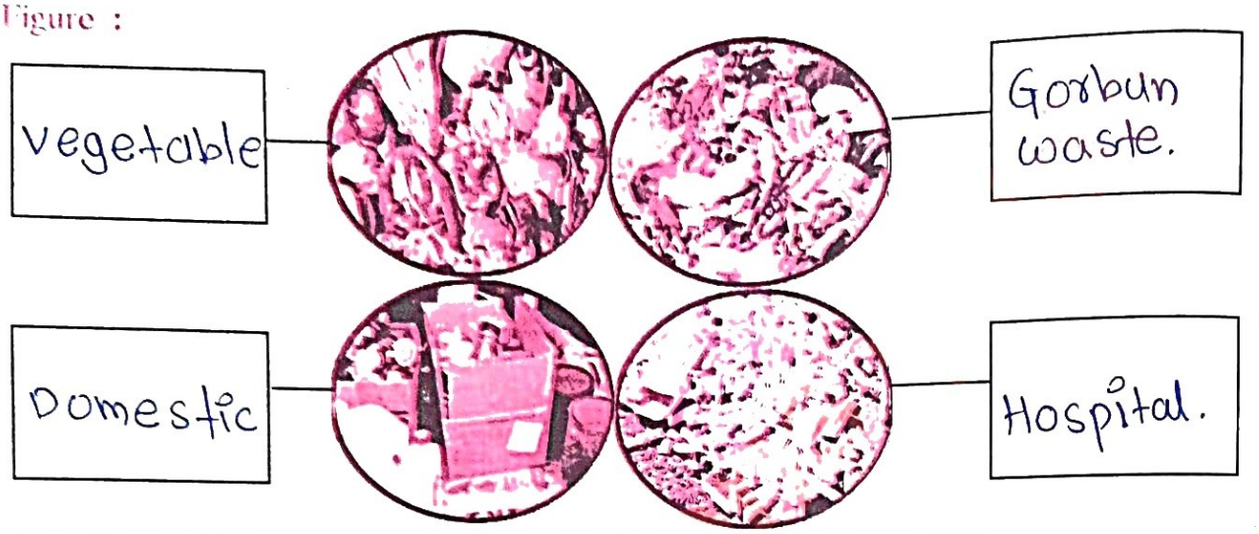
Experiment No.8

Title : Configure the garbage from the surrounding and make compost by using degradable garbage.

Materials : All collected garbage, Spade, shovel, etc.

Figure :



Procedure : Make a group of 10 to 15 students to perform the activity.

1. Clean the classroom and school campus.
2. Configure the garbage into two groups under the guidance of teacher.
3. Dig a pit of 3 ft broad and 4 ft deep in corner of school campus / ground.
4. Keep all collected bio-degradable garbage in the pit , cover it with layer of soil and sprinkle water on it.
5. Repeat this process till the pit is completely filled.
6. At the top pour a mixture of dung in the water and spread soil layer on it.
7. after every 2 days sprinkle some water on the pit
8. Approximately after a month take a sample of soil from the pit.
9. Use this soil (compost) in the school garden for plants. (do not use this compost for all plants in the garden.)
10. Compare the growth of plants between given compost provided plants and non provided plants by specific criteria.

Observation 1

Complete the following table as per garbage configuration.

Bio-degradable Garbage	Non -degradable Garbage
food, Garden waste wood.	Glass, Rubber, metal, Plastic.

Observation 2

List the difference between the growth of plants on using compost manure produced by using bio-degradable garbage and the growth in plants without using compost.

Growth of Plant on using compost	Growth of plant using without compost.
1) Plants growth is well.	1) Plants growth is not well.
2) leaves are the Green	2) leaves are the yellowish.

Multiple Choice Questions

1. The primary process in management of solid waste is.....
   A. land filling 2. Classification 3. Transportation 4. Burn the garbage
2. For degradation of solid waste ..... .is also necessary with micro-organisms
   A. heat B. breeze/air C. water D. soil
3. Compost manure is known by farmers as .....
   A. yellow gold B. black gold C. red gold D. white gold
4. For the disposal of non degradable garbage .....process is used .
   A. recycling B. reuse C. incinerator D. all three

Questions

1. What is solid waste management?

1) Sepration and categorization of waste.
2) Biomedical waste management.
3) composting.
4) safe land fill sites are solid waste management.

2. Why the classification of garbage is essential?

1) classification is important so we condesign more waste to dograde the garbage. 2) It is also important so we can create a salt about how much materials reman the population uses every year.

3. How the non-degradable garbage can be useful?

No-degrable covers in an umbrella term which covers a huge varieties of garbage such as plastic glass, metal, steel and paper etc.
Example :- steel & metal.
