

Chapter 5: Precipitation

Q. 1. Observe the following pictures and describe them in four to five lines each :

Description : The blades of grass look like this on winter mornings. Those tiny droplets you see clinging to the blades of grass are called 'dew'. Dew is liquid water droplets that form on grass, spider webs, and other things.

Description : Snow is found everywhere in the winters in Kashmir. It is located at a higher altitude where the temperature falls below the freezing point. Hence water vapour directly turns into snowflakes leading to snowfall.

Description : Generally, it rains between June and September in our region. While these winds move over the Indian Ocean, they pick up large amount of moisture. This precipitates as rainfall in our region.

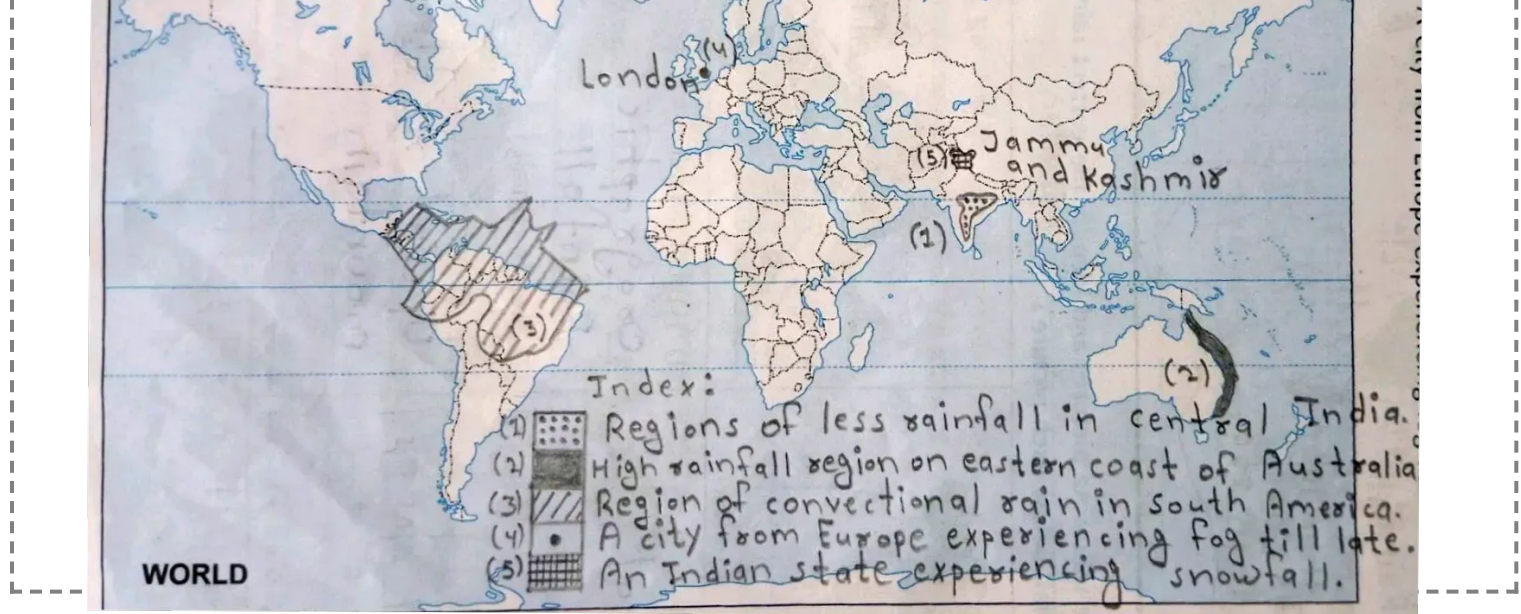

Description : In London, there is fog like this till the afternoons in the winters. Fog reduces visibility and hence the parliament building, other buildings and London tower across Thames river are not clearly visible.

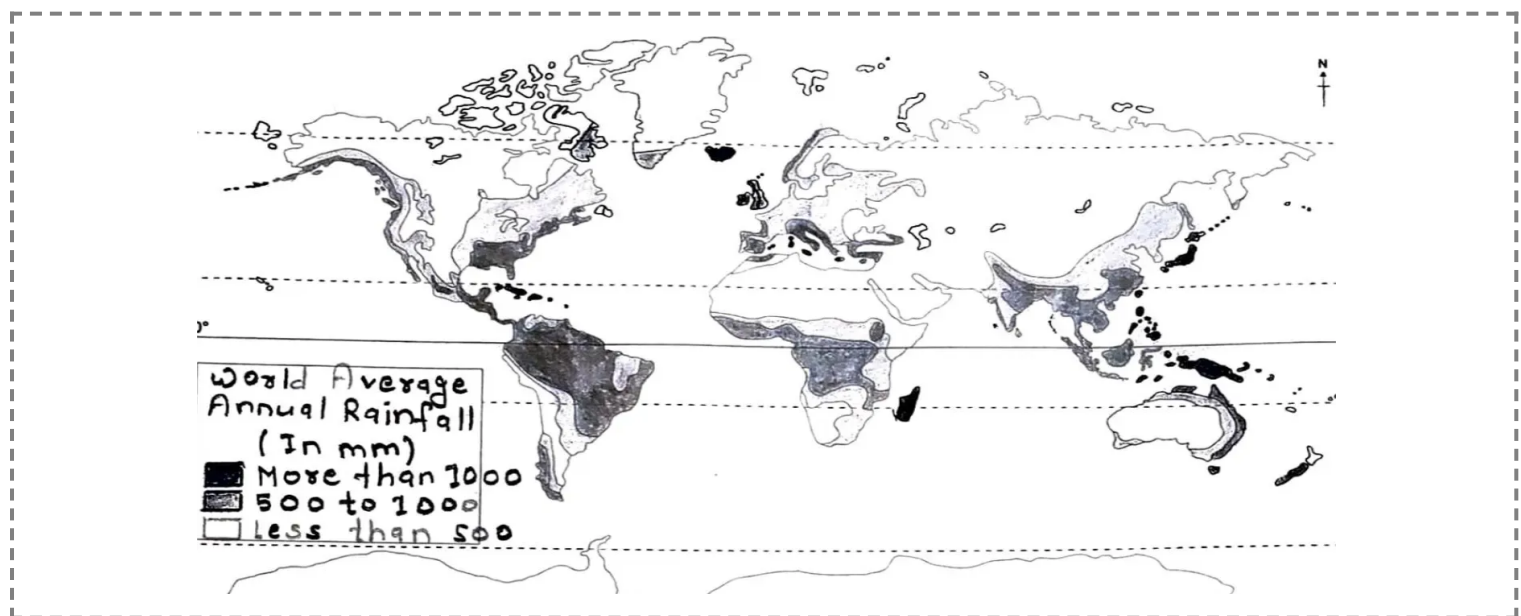

Description : Sometimes hailstorms destroy the standing crops in the fields. Hailstorms are snow type solid balls. As they fall on the earth due to atmospheric conditions, they cause damage to the standing crops.

Q. 2. Show the following details with suitable index in the world map given below :

- (1) Regions of less rainfall in Central India
- (2) High Rainfall region on eastern coast of Australia
- (3) Region of heavy rainfall near the equator

Q. 3. Show the distribution of the rainfall in the world by using isopleths method in the world map given below :

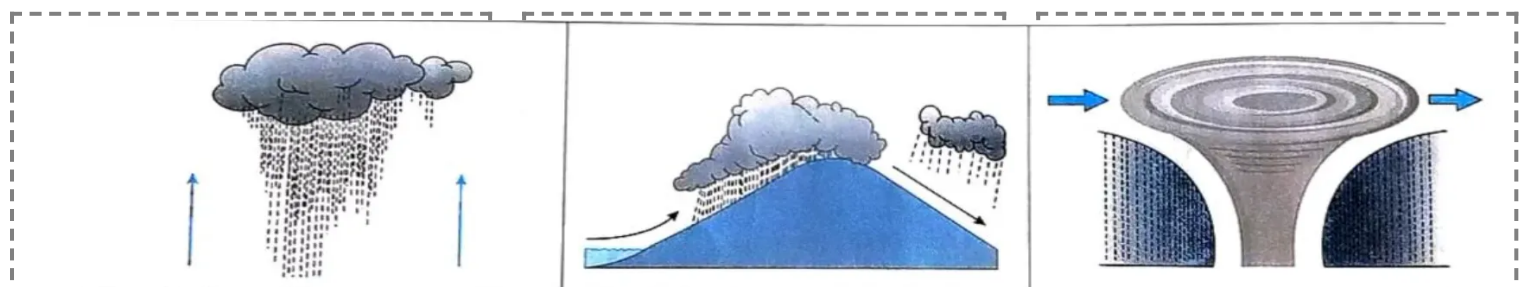

World Average Annual Rainfall (in mm):

More than 1000

500 to 1000

Less than 500

Q. 4. Observe the following pictures and identify the correct rainfall type. Also mention the area of type of rainfall below each picture :

(1) Type of rainfall : Convectional rainfall

(2) Area of rainfall : Tropical areas

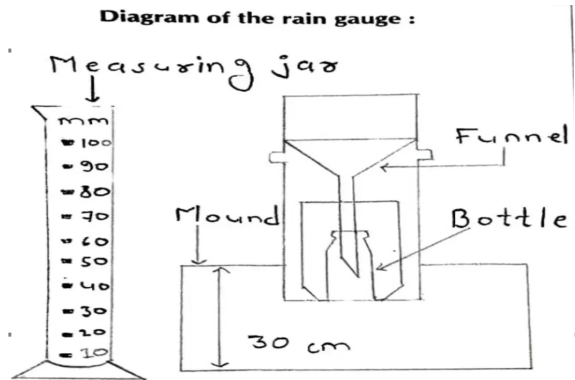

(1) Type of rainfall : Orographic rainfall

(2) Area of rainfall : Windward side of mountains

(1) Type of rainfall : Cyclonic rainfall

(2) Area of rainfall : Tropical and temperate regions

Q. 5. Draw a diagram of the rain gauge and write brief information about the same in the space given below :

(i) The instrument that is used to measure rainfall is called as rain gauge.

(ii) The funnel that is used for measuring rain has a specific diameter. The rain falling in this funnel is collected in a bottle fitted in the gauge.

(iii) The gauge is kept on open ground on a 30 cm flat mount.
